

John Spicer

I pledge my honor that I have abided by the Stevens Honor System.

10/20/15

5. a.  $O(V^2)$   
b.  $O(V + E)$

6. a.  $O(V^2)$   
b.  $O(V + E)$

7. Adjacency list is much better if the number of edges is low, but there are many vertices. Matrix always uses  $O(V^2)$  memory while the list can save a lot of memory as it is proportional to the number of edges.

8. The only nodes that can be reached are 1 (indegree of 0), and 2 (indegree of 0 after reaching 1). Every other node has an indegree of 1 or more and is impossible to reach, making topological sort impossible.

9. 1, 4, 2, 5, 6, 8, 9, 7, 10, 3
